

DAY 3: CONFIGURING BASIC NETWORK HARDWARE

GitHub Assignment • Ready for Submission

Theory	IP Addressing Basics and Network Configuration
Practical	Set up a router with default settings
Status	Completed / Ready for Submission

Objective

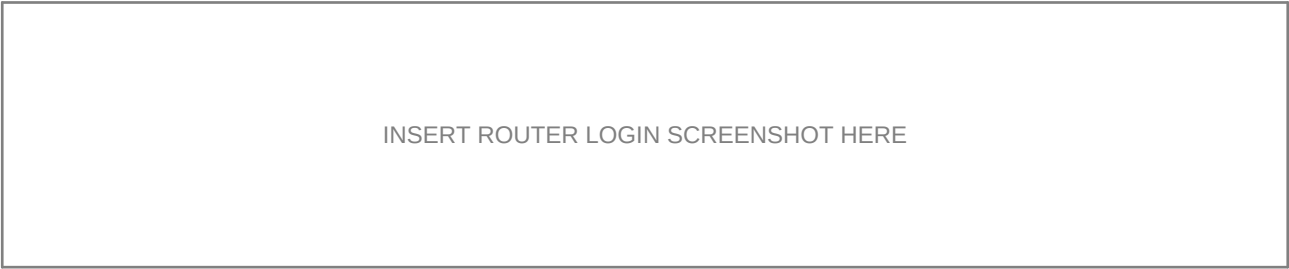

To understand basic IP addressing, identify DHCP-assigned network details, configure a static IP address for testing, and understand the router's DHCP range.

Task 1: Router Admin Panel Login

The router admin panel can usually be opened using the default gateway address such as **192.168.0.1** or **192.168.1.1**.

Steps: 1. Connect to Wi-Fi. 2. Open a browser. 3. Enter the default gateway. 4. Enter the router username and password.

Screenshot Placeholder: Router Admin Login Page

Task 2: Current Network Details

Network Detail	Example Value
IP Address	192.168.1.50
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.1
DNS Server	192.168.1.1

Note: Actual values may be different depending on the Wi-Fi router.

TASK 3: CONFIGURE STATIC IP

The device was temporarily changed from DHCP (Obtain IP Automatically) to a static IP address in the same network range.

Setting	Example Configuration
IP Address	192.168.1.50
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.1
DNS	192.168.1.1

After applying the settings, internet connectivity was tested. After testing, the device was changed back to **Obtain IP Automatically (DHCP)** to avoid network issues.

TASK 4: DHCP RANGE

The DHCP range is the group of IP addresses that the router automatically assigns to connected devices.

Example DHCP Range: 192.168.1.100 – 192.168.1.200

If two devices are assigned the same IP address, an **IP conflict** can occur. This may cause internet or network connectivity problems for one or both devices.
